INTRODUCTION

Following the agreement in March 2013 with the EU, the ECB and the IMF (the Troika) on a Macroeconomic Adjustment Programme (the Programme) during the year 2014 Cyprus' economy was underway in a number of significant reforms and actions on fiscal, banking and structural issues. During this process and while the state relied on the Programme ESM-IMF funding for most of its financing needs it was able to borrow again in the international markets marking a critical point in re-establishing the sovereign regular market access.

The principles and actions of the year as regards the management of the public debt followed the direction set in the Medium Term Debt Strategy (MTDS) 2014-16. The MTDS 2014-16 laid the foundations, the important challenges and the directions of debt management for the following years. The guidelines indicated the necessity to develop the domestic market and broaden the sources of funding as a precaution to prepare for the exit from the Memorandum of Understanding with the EU, the ECB and the IMF in March 2016. They also referred to actions for managing the large redemptions in the coming years and establish market access and point out the general direction to be taken in the medium term to manage refinancing and interest rate risks.

Initial market re-entry was achieved earlier than anticipated. Indeed following a small private placement to international investors in May, the first international benchmark issuance since 2010 was launched in June 2014, a year after the start of the Macroeconomic Adjustment Programme. The proceeds of the new 2019 bond were used to repay early part of a domestic bond due in 2017, contributing thereby to the smoothening of the debt maturity profile. Additionally the weighted average maturity of debt, the average cost of debt and cash buffers were maintained within the targets stipulated in the MTDS 2014-16. No additional interest rate and foreign exchange risks were assumed in the debt portfolio in line with the MTDS 2014-2016 principle of financial risk mitigation. Finally, the Treasury Bills issuances were streamlined and maturities were re-aligned towards the year end with the aim of normalizing issuances via auctions over 2015.

Additionally towards the year end the PDMO conducted a non-deal roadshow in main European financial centres to inform investors on the economic developments and prospects of Cyprus.

Some issuance activity in the Euro Commercial Paper market was achieved but this was diverted to domestic investors with particular preference for this debt instrument. Indeed, there has been no activity of investors in the ECP market, despite parallel improvement in the access in the long term international market.

An investment framework for excess liquidity was adopted in early 2014. This allowed for the investment of surplus cash in the form of fixed term deposits or purchase of short term government securities. Given the restructuring phase of the banking sector and the conservative investment guidelines set in the investment framework the PDMO proceeded with the placement of small bank deposits over a short period of time.

During the year technical assistance was sought from the International Monetary Fund and the European Stability Mechanism on all debt management aspects.

The International Monetary Fund helped towards the design of a medium term debt strategy which was then drafted by the PDMO and adopted by the Council of Ministers for the years 2015-2019. The MTDS 2015-2019 aspires to pave the way for a sustainable return to the market access. The guidelines of this MTDS are the following four: (i) Smoothening out the maturity profile of marketable debt; (ii) Risk mitigation through increased cash reserves and management of foreign exchange and interest rate risk; (iii) Development of the government securities market; and (iv) Minimisation of medium-term cost of public debt.

In sum, this MTDS reflects all planned actions that have to be taken in a concerted manner in order to achieve stable market access combined with fiscally sustainable cost of borrowing, under acceptable levels of financial risks.

Additionally, the technical assistance of the European Stability Mechanism has focused on strengthening the infrastructure, enhancing the market intelligence function, upgrading the guarantees risk assessment methodology and designing the PDMO's internal controls system. The first report of recommendations by the ESM was delivered in December 2014.

Once the report is finalized a consultation between the ESM and the Cypriot authorities will take place for the adoption of a roadmap for the implementation of the pertinent recommendations. This is expected to commence by mid-2015 and will last throughout the MTDS reference period, i.e. until end 2019.

EUROZONE SOVEREIGN DEBT MARKET DEVELOPMENTS

Developments in the Eurozone sovereign debt markets over the course of 2014 were characterized by tightening yields and improvement in the market access for all member states. In certain member states yields are at historically lows reaching in some cases negative levels.

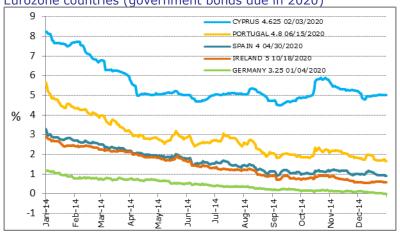

The year's improvements in the primary markets influenced positively also those Eurozone countries under or recently exited a programme. In January 2014 Ireland proceeded with its first post programme syndication, while in the same month its investment grade status was fully restored by the three main credit rating agencies. In May, Portugal exited its Programme and proceeded shortly afterwards with a primary market issuance. Greece and Cyprus, whilst still under Programmes, issued again in the international markets after a four-year absence period.

Following a continuous downward rally in nearly the entire first half of the year most Eurozone sovereign yields rebounded temporarily partly due to investors' concerns over the Eurozone growth and recovery prospects.

The announcement of results of the Asset Quality Review and stress tests by the ECB in October did not have significant impact on the sovereign bond markets as market participants seemed to have anticipated and priced its outcome. A volatility episode occurred on 15 October 2014 resulting to a brief yield spike across the Eurozone. This event seems to have been mainly influenced from a volatility increase on the US Treasuries market. While having profoundly influenced the market throughout the year, increased expectations on Quantitative Easing by the ECB exerted further downwards pressure on the yields again towards the year end.

Over the year five euro area sovereigns had their ratings upgraded. The credit ratings of Ireland, Portugal, Spain and Greece were raised. Cyprus' credit rating was also raised between two and three notches over the year.

Figure 1: Secondary market yield levels of Cyprus and selected Eurozone countries (government bonds due in 2020)

Source: Bloomberg

Following the trend of late 2013 during the first four months of 2014 the Cyprus yields continued their tightening rally. Yields remained broadly stable until October 2014 when volatility around Eurozone liquidity impacted the yields negatively. These fell again following the announcements of the ECB asset quality reviewstress tests in late October. The improvement in the Cyprus sovereign yields was related both to the positive assessments of the adjustment programme and to the general positive market developments in the Eurozone. Despite these macroeconomic fundamentals the low liquidity in the small debt market of Cyprus generally impacts the volatility and yield reaction.

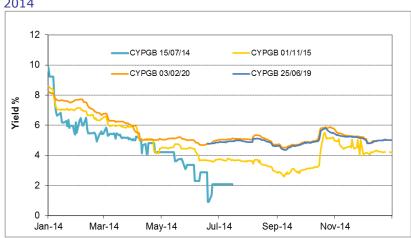

Figure 2: Secondary yield levels for Cyprus international bonds in 2014

Source: Bloomberg

The above diagram shows the yield evolvement of the Republic's international bonds, all launched under its EMTN Programme and listed at the London Stock Exchange. Liquidity for the domestic bonds listed at the Cyprus Stock Exchange remained at low levels although the trading activity around the domestic bonds increased compared to previous years, reflecting possibly larger visibility of Cyprus and search of yield by investors.

Given the secondary market shortcomings for the assessment of the cost of funding of Cyprus the primary market is of particular importance. This is further analysed in the chapter "Financing of the central government in 2014".

FINANCING OF THE CENTRAL GOVERNMENT IN 2014

The public debt remained in a generally stable level increasing from \in 18,48 billion at end 2013 to \in 18,76 billion at end 2014. With the budget balance of the central government in cash terms recording a slight surplus, the increase in the public debt is related to the enhancement of the state liquid assets.

As far as the borrowing instruments are concerned these were a mix of market and official sources. The current chapter focuses on the presentation and analysis of the annual *flows* of government financing i.e. the annual issuances and repayments.

(i) Financing of the borrowing needs of 2014

The net annual borrowing of the year, i.e. excluding short term funding of €3365 million issued and matured within 2014, was €4045 million. In total the gross annual borrowing was €7411 million including once more a large component of continuously rolled over short term debt (Table 1).

As Table 2 outlines most of the annual borrowing was issued in fact in the form of government securities. This includes however the rollover of the bank recapitalization bond and the short term debt in the form of Treasury Bills and Commercial Papers. New borrowing in the form of securities was made via the new Euro Medium Term Notes and the newly launched retail bond.

Loans made up about one third of the borrowing actions of the year and related mainly to disbursements under the ESM-IMF financing schedule.

Total annual financing	4045	100

Note: The figure of €4045 million does not include debt issued and redeemed within 2014

Total annual financing comprised of the net annual borrowing as well as financing from the cash surplus in the budget. Half of the annual financing was directed towards the Bank of Cyprus, through repayment and rollover of government bond. The remaining financing was undertaken for the redemption of debt maturities and some was used to accumulate liquid assets of the state (Table 4).

A description and analysis of the government financing by tenor and instrument is provided below.

Short term borrowing

Treasury Bills: Treasury Bills were issued and rolled-over throughout the entire year.

In total Treasury Bills amounting to €3445 million were issued out of which €2748 million or 80% matured within the same calendar year. The remaining €697 million will mature within 2015.

The cost of short term borrowing continued to be high even though it followed a declining trend. The volume-weighted average yield was 4,14% down from 5,00% of the previous year.

Treasury Bills were issued by private placements only. The investors during the year were banking institutions, public sector legal entities and pension and provident funds, all being Cyprus residents.

Euro Commercial Paper (ECP): Total ECPs issued during 2014 were of the order of €677 million. This figure reflects to the largest extent a continuous rollover of one-month ECPs. At year end €40 million were outstanding. The weighted average yield of ECP issuance was 4,66% for maturities of 1 to 3 months.

Medium and long term borrowing

The Republic issued two bonds to the international market under the EMTN Programme, one via syndication and the other by private placement. It also received the fourth, fifth and sixth tranches by the ESM and the IMF and secured long term financing for infrastructure projects from the European Investment Bank and the Council of Europe Development Bank¹.

Government securities:

A Euro Medium Term Note was issued via private placement in May 2014 for a nominal amount of \in 100 million due in 2021 and a coupon rate of 6,50%. This was the first issuance to international investors since late 2010. This placement together with the overall Eurozone favourable developments of the time reactivated demand for Cyprus bonds and created the conditions to proceed with a 5-year benchmark bond issuance in June 2014 for a coupon rate of 4,75% and a nominal amount of \in 750 million. This benchmark bond initiated the gradual return to the international capital markets of the Republic of Cyprus after a four-year absence (see Box).

Moreover in May a new retail bond was launched under domestic law to natural persons only. The bond, issued in monthly series, has a tenor of 6 years with an option of early repayment after a 30-day notice period and carries a step-up coupon rate. The 2014 bond carries a coupon between 2,75% - 5,75%, which averages a return of 4,125% if the bond is held for the entire 6-year period. The total amount raised in the first 8 months of issuance was €61 million.

¹ The sixth tranche by the IMF was postponed due to delay in the implementation of the foreclosures legislation.

Loans:

The disbursements from the ESM and the IMF totaled €1267 million which resulted from €233 million of the fourth tranche in April, €684 million of the fifth tranche in July and €350 million of the sixth tranche in December. The ESM disbursed €1100 million whilst IMF the remaining €167 million.

Finally, the European Investment Bank (EIB) and the Council of Europe Development Bank (CEDB) disbursed amounts of $\[\in \]$ 15 million and $\[\in \]$ 25 million respectively for project financing of primary and secondary education. The loan of the EIB carries a floating interest rate of 0,99% over the Euribor rate, whilst the loan by the CEDB carries a fixed interest rate of 1,46%. They are both amortised annually with the final capital payment due in 2039.

Box: Cyprus €750 million 4,750% 5-year benchmark bond due 25 June 2019

Following positive secondary market yield developments since the beginning of 2014 supported by strong progress in the Economic Adjustment Programme and after an earlier small private placement, Cyprus launched a new benchmark bond initiating its gradual return to the international capital markets. The 5-year benchmark bond has a nominal amount of $\[\in \]$ 750 million and a coupon of 4,750% (yield 4,850%).The bond was the first international benchmark bond issuance of Cyprus since late 2010.

The mandate for the organization of a series of fixed income meetings was announced on 10th June. A global investor call was arranged on 13th June and physical meetings in London on 16th-17th June enabling Cyprus to update investors on (i) the recent developments with regards to the implementation of the ESM/IMF programme, (ii) the general economic situation and fiscal performance (iii) the financial situation of the banking sector and (iv) the expected funding programme and financing actions for 2014 and 2015.

Given very constructive feedback received from investors during the roadshow, initial pricing thoughts (IPTs) were released on $17^{\rm th}$ June for a 5-year Euro benchmark at 5% area (yield). For reference, the secondary trading level of the Republic's existing note maturing in February 2020 was 4,80% in yield.

Following a very constructive IPT process with $\in 1,5$ billion of interest, the orderbook officially opened on 18^{th} June with guidance at 4,90% area (yield).

The orderbook grew steadily and closed at 11:30 CET with more than 150 investors taking part to the transaction and a total amount requested close to €2 billion enabling to launch a €750 million transaction (from €500 million minimum initially targeted) at 4,85%. The transaction priced at 15:20 CET at a reoffer yield for investors of 4,85% implying a spread of 414,1bps over the mid-swap reference.

Figure 4: summary of distribution

(ii) Debt redemptions

During 2014 a total of €1061 million of medium and long term debt was redeemed. About half of this formed two EMTNs of total €585 million with the rest being attributed to domestic bond maturities and loan amortisations.

The continuous rollover of short term securities of €750 million in tenors of just 1 to 3 months throughout the year caused a surge in the debt maturity aggregate figure. The continuous refinancing resulted in the gross maturity figure of about €4,1 billion for Treasury Bills and ECPs. The annual change in the stock of short term debt was in fact a reduction of €26 million.

A further significant component of debt maturities was the Bank of Cyprus recapitalisation bond of $\in 1,99$ billion which matured in July. According to the terms of the recapitalization bond the government has a unilateral option to roll it over until July 2017. The actual redemption for this bond was $\in 950$ million so that a new zero-coupon bond for $\in 1091$ million was issued.

This resulted in ameliorating the maturities of the year 2017, right after the end of the Macroeconomic Adjustment Programme.

The full list of debt redemptions of the year is shown in Tables 12-14 of the Statistical Appendix.

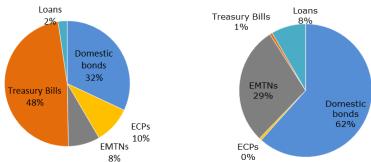

Figure 5: Gross and net debt redemptions in 2014

Review of the annual financing profile

With the cash budget recording a balanced outcome the annual financing needs related entirely to the refinancing of debt. The disbursements by the ESM-IMF of $\[\in \]$ 1267 million more than compensated the year's medium-long term debt redemptions of $\[\in \]$ 756 million. The financing needs of the state were covered comfortably and further liquid assets were accumulated.

Despite the above the refinancing risk stemming from short term debt remained high, particularly in the first half of the year. Treasury Bills were issued via private placements while the weighted yield averaged 4,48% in the first quarter of 2014 to decline to 3,51% in the final quarter.

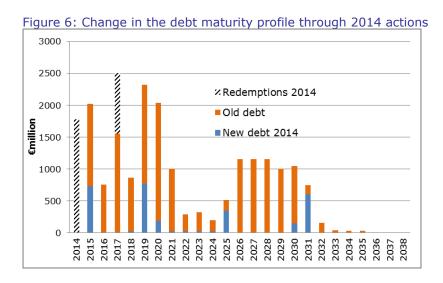

The long term market issuances were significant both in terms of signaling the gradual return of the sovereign to the international capital markets as well as for the use of their proceeds to repay early domestic debt and thus smoothen the maturity profile. An overview of the change in the maturity profile from the actions of 2014 is shown in Figure 6. The new issuances due in 2015 relate to short term debt, those of 2019-2020 to the international bonds whilst the new debt in further years relates to the Programme loans.

Cyprus attracted again international investors whilst only a few domestic investors participated in the government short term and long term debt issuances. This was an unsurprising development given the restructuring stage of the main domestic credit institutions.

The volume-weighted borrowing cost of gross short term securities was 4,14 % and that of long term issuances 5,09%². The weighted average of the market borrowing cost was 4,73%. Including the borrowing from official sources, the annual borrowing cost is estimated at 3,51% based on year-end base rates for the floating-rate debt.

_

 $^{^{2}}$ The bank recapitalization bond is assumed throughout this report to be a long term security due in 2017.

THE SIZE AND COMPOSITION OF GOVERNMENT DEBT

The Maastricht criterion for public debt is defined as the gross debt of the general government at nominal value, consolidated over the sectors of the general government. In the case of Cyprus the relevant subsectors are the central government, the local authorities and the Social Security Fund.

Sections (i) and (ii) show the size, historical evolution and structure of the consolidated general government debt, whereas section (iii) deals separately with the unconsolidated general government debt. Valuation and methodology is according to the Eurostat definition of public debt in ESA2010 terms.

(i) Size and evolution of general government debt

Evolution of government debt

The debt to GDP ratio marked an increase over 2014 from 102% to 107%. This increase is related to accumulation of cash since the annual fiscal outcome in cash terms was slightly positive and the reduction in nominal GDP.

The accumulation of debt over the past few years has caused significant scrutiny and analysis of the sustainability of debt. The joint assessment in 2013 by the IMF and the European Commission concluded that via the €10 billion Economic Adjustment Programme the public debt was sustainable and following a declining path up to the foreseeable horizon of 2020. Since then the debt sustainability analysis has been repeated at regular intervals reaching to the same conclusion.

In the decade between 1995 and 2004 the general government debt followed an increasing path from 47% of GDP to 65% of GDP. Following years of fiscal consolidation, and due to the use of available sinking funds, the debt-to-GDP ratio reached a low of 45% of GDP in 2008. Since then, fiscal slippage and low to negative growth rates and, most recently, capital injections into the banking sector, contributed to a considerable increase in the debt relative to GDP.

Between 2009-2011 the fiscal deterioration was the main contributor to the increase in the public debt. Between 2012-2013 both the fiscal deficit and the negative growth rate contributed to

the debt deterioration but additionally the state capital support of the Cyprus Popular Bank in 2012 and of the cooperative sector in 2013 increased the public debt by a total of $\in 3,3$ billion.

The banking crisis resulted in state support to the domestic bank of currently €2,5 billion or about 14% of the gross public debt by end 2014. These funds relate to the state recapitalisation of Cyprus Popular Bank and the cooperative sector via debt securities. Further €950 million of the bank recapitalisation bond to Cyprus Popular Bank have been repaid to the Bank of Cyprus.

It is important to highlight that despite the sharp increase in the public debt of the past few years the strong fiscal outcome of 2014 and the positive growth of 2015 indicate that debt is stabilising earlier and at lower levels than originally anticipated.

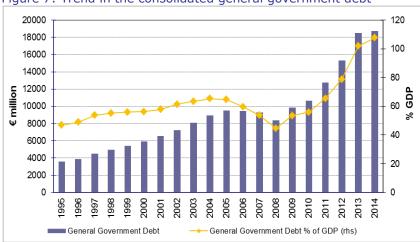

Figure 7: Trend in the consolidated general government debt

Maturity profile

The weighted average maturity of the general government debt is 8 years. Whilst in average terms the maturity is strong, a significant share of debt (about 40%) falls due within 5 years with 2019-2020 presenting the peak maturities. As in the past, the peak maturities relate to Euro Medium Term Notes. The longest debt redemption point is the year 2039.

The IMF loans disbursed to date are due between 2017 and 2024. The loans by the ESM have an average maturity of 15 years and the currently outstanding disbursements are due between 2025 and 2031. Under the new terms the bilateral loan from the Russian Federation has an annual amortization between 2018 and 2021.

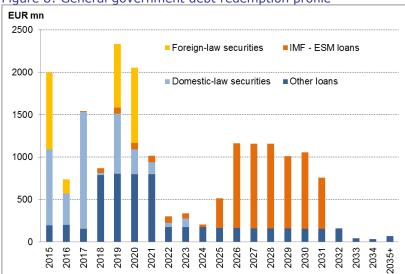

Figure 8: General government debt redemption profile

Note: the government bond for the recapitalization of Cyprus Popular Bank is due in 2015 with the possibility of extension up to 2017. In this figure it is shown to mature in 2017.

(ii) Composition of the General Government Debt

Short term and long term debt

Short term debt, i.e. debt with an original maturity of up to 12 months, has experienced a sharp decline since the mid 1990's. The bulk of this type of borrowing by the government was undertaken from the Central Bank of Cyprus which, in contrary to market-based financing, entailed no refinancing risk. In 2002, with the abandonment of Central Bank financing all pending obligations of the government with the Central Bank of Cyprus were converted into a 30-year loan, thus immediately reducing the short term debt balance from 40% of outstanding debt in 2001 to just 5% in 2002. After 2005 short term debt remained below the threshold of 10%

of outstanding debt. In the last two years the share of short term debt remained at 4% of outstanding debt.

It is noteworthy that the Cyprus Popular Bank state support was in the form of a one year zero coupon government bond, with an option for the Government to rollover until 2017. Thus, the bond can be considered as a medium-term obligation and is not included in this Report in the short term debt. With the resolution of Cyprus Popular Bank in 2013 the bond was transferred to the balance sheet of Bank of Cyprus.

The total debt, i.e. both short term and long term, with *remaining* maturity within 12 months, is analysed in the chapter "Risk management".

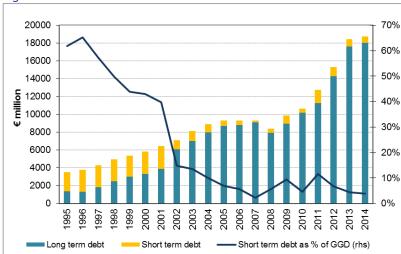

Figure 9: Evolution of short term debt

Breakdown by financing instrument

The Cyprus' debt is composed of official and private loans as well as foreign-law and domestic-law securities (Figure 10).

During the year the share of loans increased in the total of debt both in absolute and relative terms due to the redemption of securities and their replacement via ESM and IMF loans. In absolute terms, foreign securities remained fairly stable due to new issuances whilst domestic securities decreased.

Short term financing instruments, i.e. Treasury Bills and Euro Commercial Papers, accounted for about 4% of outstanding debt. Figure 11 shows the breakdown of the category of loans. Foreign loans make up about 84% of total loans. They are composed by the loans by the ESM, the bilateral Russian loan and long term loans from the EIB and the Council of Europe Development Bank. Finally, the loans granted via the EFSF to Greece, Ireland and Portugal, as attributed to the creditor countries including Cyprus, are included in the debt statistics³.

Loans from domestic sources represent 14% of the outstanding stock of loans. The long term loan from the Central Bank of Cyprus signed in 2002 with the abandoning of state financing from the Central Bank forms the largest component of domestic loans. Another sizeable loan was concluded with the Cooperative Central Bank from 2007 and relates to school committees, which are part of the central government. A further component is formed by the bank loans of the state owned enterprises categorized within the central government. Finally, there is a large number of outstanding bank loans of local authorities mainly granted for infrastructure projects.

Loans are predominately from official sources, as commercial bank loans are about 6% of the loan stock (Figure 11).

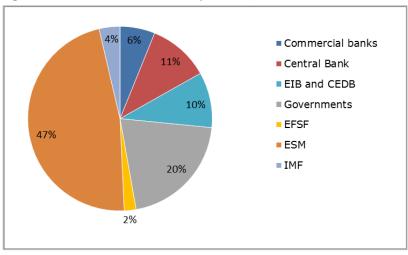

³ The creditor countries have an equal amount of assets, as loans granted, in their balance sheet corresponding to the share of liabilities, i.e. the accumulated debt by the EFSF. However, any assets which may offset debt are not included in the general government debt, as this is reported on a gross basis.

Treasury Bills ECPs
4% 0% Domestic bonds
17%

Loans
64%

Figure 10: General government debt by instrument, 31 Dec. 2014

Figure 11: Breakdown of loans by source, 31 Dec. 2014

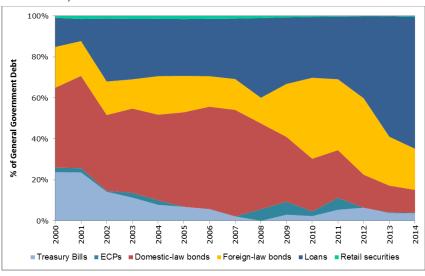

In a historical comparison, Figure 12 shows the breakdown of debt stock by financing instrument.

It is apparent that the contribution of loans to the total of debt has gradually increased over time. The sharp increase of 2002 relates to the conversion of outstanding central bank financing into a long-term loan for the amount of $\in 1,64$ billion. In 2012 the proportion of loans increased due to the replacement of debt as securities by the bilateral Russian loan. Similarly the large financing via ESM loans further increased the share of loans in the debt over 2013 and 2014 so that about two thirds of the current outstanding stock of debt is in the form of loans.

During 2009-2010 the EMTN securities replaced the state traditional borrowing from the domestic market. Importantly since 2009 there had been no significant issuance of the domestic bonds, except for the recapitalization bond, indicating that the domestic debt market is diminishing in size and importance and a switch to the international capital markets is taking place.

Figure 12: Historical breakdown of general government debt by instrument, 31 Dec. 2014

Breakdown by interest type

All debt securities carry fixed interest rate, although issuance of bonds and notes at other coupon types is available. The variable interest rates in the debt portfolio stem exclusively from loans.

An important change in the debt stock characteristics has been taking place since 2013 due to the borrowing by the ESM and the IMF at floating interest rates. This borrowing, which replaces old mainly fixed-rate, debt has contributed to the increase in the variable-rate debt share. Furthermore, loans by the European Investment Bank and the Council of Europe Development Bank carry typically floating rates with low margins over the Euribor. Moreover, a €417 million long term loan from a local bank for School Committees is indexed to floating rate. Finally, nearly all loans of the local authorities and state owned enterprises from domestic credit institutions carry floating interest rates.

In total, the proportion of floating interest debt stands at 42% of the general government debt or at €7905 million. Although this is a considerable share a further breakdown of floating-rate debt indicates that most loans are indexed at low margins over the Euribor rate whilst the interest rates of the ESM and the IMF loans are forecast to remain at low levels in the long term (see also Chapter "Risk management").

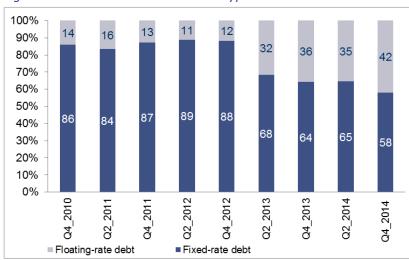

Figure 13: evolution of interest rate type of debt

Breakdown by currency

Cyprus currently follows a policy of issuing preferably only in euros. However, securities can be issued in foreign currency when opportunities arise. Such issuances are simultaneously fully hedged via swap agreements.

At end 2014 there were no debt securities denominated in foreign currency. However loans by the IMF are denominated in Special Drawing Rights an international reserve asset whose value is determined by a basket of four currencies⁴. Servicing of the IMF loans is thus executed in SDRs which carry a foreign exchange risk. At end 2014 loans of IMF were the only debt in foreign currency and made up 2% of the total debt stock. By the end of the Programme period this component is projected to rise but not exceed 5% of the outstanding debt.

Breakdown by government sector

The three subsectors of the general government in Cyprus are the central government, which includes all activities under the state Budget and some state-owned enterprises⁵, the local authorities and the Social Security Fund.

According to the Eurostat definition the public debt is reported in consolidated form, i.e. any obligations among the general government subsectors are not shown explicitly.

The vast majority of the consolidated General Government debt, in gross terms, is made up by the central government debt, which is analysed in detail throughout this Report. At 31 December 2014, the outstanding central government debt accounted for 99% of the general government debt. This share has historically been fairly constant.

In absolute terms, the local authorities' debt increased steadily over the years, albeit at low growth rates, until the year 2011

4

 $^{^{4}}$ The euro is one of the four base currencies, a fact that contributes positively to the containment of the volatility of the SDR/EUR exchange rate.

⁵ The state owned enterprises categorised within the central government and which have an outstanding debt balance are the Cyprus Organisation for Storage and Management of Oil Stocks and the Cyprus Sports Authority.

where a first absolute level reduction appeared. Since 2011 the stock of local authorities' loans has been declining due to continuous amortisation and absence of new borrowing. At end 2014 the stock of the local authorities' debt was €125 million. This marked a significant reduction over end 2013 debt of the local authorities which stood at €255 million. Indeed, during 2014 the central government assumed a new loan with a foreign bank replacing various local authorities as debtor. The borrowing of local authorities relates normally to infrastructure projects and typically the creditors are local credit and cooperative institutions. This debt is thus in the form of long term bank loans with a floating interest rate.

The third subsector of the general government, the Social Security Fund, does not have an outstanding debt balance. On the contrary, the Fund records an annual surplus which is invested with the central government, the total balance of which constitutes intragovernmental borrowing. This intragovernmental assetliability relation is presented in section (iii) of this Chapter.

Breakdown by investor origin

The Public Debt Management Office as the debt issuer has full investor records at the primary market. Given that domestic securities listed in the Cyprus Stock Exchange have low tradability the issuance records can be considered representative of the secondary market investor profile. The reverse holds for the foreign-issued EMTN bonds, whereby secondary market trading is more active. Secondary market records are available only to international depositories (Euroclear and Clearstream).

Historically, foreign capital inflows related to debt purchases were recorded either via supranational organisations, such as the EIB, or via the short term ECP securities. Long term securities were issued for the first time in 1997 for USD300 million. Further issuances followed during 1998-1999 and 2002-2004 in euro as a foreign currency. These issuances naturally increased the share of foreign investors in the total debt.

During 2009 and 2010 foreign issued debt increased considerably with the placement of three securities for $\le 1 - 1,5$ billion each. The majority of investors at these issuances were non-residents. In 2012 foreign creditor share increased further through the bilateral loan from the Russian Federation. The state recapitalization of the

banking sector during the same year affected the resident ownership of debt. Hence in relative terms the foreign and domestic ownership share in 2012 remained stable.

Over 2013 a large redistribution of debt holdings took place, which was enhanced in 2014. More specifically, foreign and domestic capital market investors were replaced by foreign official debt holders in the form of loans. This category exceeded half the total debt holdings at end 2014. Importantly however, the share of foreign investors in securities remained constant during 2014 so that Cyprus maintained its international debt capital markets presence.

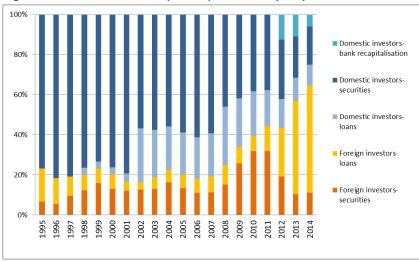

Figure 14: Debt holders at primary issuance (est.)

Note: Excluding debt for EFSF

(iii) Investments of the Social Security Fund and Administered Funds

Investments between the government subsectors, that is between the central government, the local authorities and the Social Security Fund, are not considered public debt according to the methodology followed by the Eurostat.

For Cyprus, the Social Security Fund due to its historical annual surpluses has a very large stock of investments with the central government. Investments of the Social Security Fund in the form of deposits with the government or by ownership of government securities, at the year end 2014, amounted to €7455 million. The Fund, which is reported as a single account is, in fact, composed of five different accounts:

- 1. The Social Security Fund;
- 2. The Unemployment Benefits Account;
- 3. The Central Holiday Fund;
- 4. The Termination of Employment Fund; and
- 5. The Insolvency Fund

> Intragovernmental deposits

The majority of assets of the Social Security Fund are in the form of deposits. Annually, the surplus of the SSF is invested within the government. At the year end, the balance of the SSF in the form of deposits stood at €7455 million marking a slight reduction from the previous year balance of €7586 million.

➤ Intragovernmental investments in government securities Following the decision of the Council of Ministers for the creation of a reserve, the Fund has invested in government EMTN bonds and domestic bonds. The Fund also rolled over its 52-week Treasury Bill due in November 2014 for further 12 months for a yield of 3,75% and nominal amount of €55 million. The investments in government paper totals €426 million and is presented in further detail in Table 10 of the Statistical Appendix.

It is noted that the SSF maintains also deposits with credit institutions amounting to a total of \in 62 million at the end of 2014. These funds do not constitute part of the general government debt.

- > Intragovernmental investments of the Administered Funds There are five Administered Funds of the central government with an outstanding balance at the year end of €131 million. These are:
 - 1. The Government Hourly Employees Provident Fund
 - 2. The Human Resources Development Authority Fund
 - 3. The Turkish Cypriot Properties Fund
 - 4. The Agricultural Insurance Organisation Fund
 - 5. The Hunting Fund

The surpluses of these Funds are invested in 13-week Treasury Bills.

Finally, the only intragovernmental debt existing between the local authorities and the central government is a €10 million loan which was granted in 2011 by the Municipality of Nicosia to the central government at a variable interest rate extending to 2035, with a 5-year grace period.

COST OF PUBLIC DEBT

The financial cost of the public debt is expressed mainly via the interest payments to service the debt⁶. This Chapter outlines the relative impact of interest on the economy and public finances as well the debt portfolio average cost. All relevant indicators are presented in Table 7 of the Appendix.

Brief historical overview

Historically a significant share of government revenue, reaching up to 10%, was diverted towards servicing of the public debt. The decrease of the public debt over 2007-2008 contributed to the reduction in interest payments towards 6% of the government revenue before these started increasing again from 2011 onwards.

The increase in the stock of public debt and the rise in the borrowing cost itself caused a direct increase of interest expenditure which was offset partly by the low base rates. Additionally, the negative growth rates of 2012-2013 exacerbated the impact of interest payments on the GDP. By 2013 the interest payments of Cyprus to its GDP were higher than the Eurozone average (Figure 15). The borrowing from official sources first impacted in the 2014 interest payments. These marked a decline benefiting from the considerable improvement in the borrowing cost which compensated the overall debt increase.

Another useful indicator is the weighted average cost of public debt, although this alone does not indicate its burden on the public finances or the economy as a whole. The weighted average cost of the public debt stock in the past four years moved according to the developments in the new funding, indicating the impact of new flows on the stock of debt. Between 2010-12 the average cost of debt increased to 4,2% before starting declining trend (Figure 16).

_

⁶ The cost of public debt to the society can be analysed from various aspects. For example, in the context of what is called intergenerational equity, to the extent that borrowed funds are directed towards current consumption instead of infrastructure or sustainable development expenditure, the state borrowing allows for the current generation to benefit at the cost of the next generation. Nonetheless, at moderate levels debt is considered to improve welfare and enhance growth.

Developments over 2014

Over the year 2014 interest payments as a share to GDP are estimated to have fallen to 2,83%. This improvement resulted despite the decline in nominal GDP, due to a number of factors that affected the level of interest payments.

Interest payments over 2014 benefited from the further reduction in base rates which impacted on floating rate debt, the gradual reduction in the short term borrowing cost and, clearly, from the new long-term borrowing both from market and official sources replacing older more expensive debt.

The weighted average marginal interest rate, i.e. the cost of the new borrowing raised over the year weighted by its volume, is estimated at around 3,5% based on the year-end level of base rates.

The weighted average marginal *market* interest rate of the year was 4,73% marking an improvement vis-à-vis the 5,00% short term market borrowing rate of 2013 (no long term market borrowing was feasible over 2013). Indeed the 2014 average market borrowing rate resulted from both short term and long term market issuances, indicating the first return to the international capital markets.

The weighted average interest rate for the total stock of debt improved considerably over the year. The weighted average interest rate fell from 3,03% at end 2013 to 2,92% at end 2014.

Outlook

The driving forces on the development of the average borrowing cost and the total interest payments have mixed implications.

As regards the immediate future borrowing rates, the marginal impact of refinancing on the interest payments (new debt replacing old debt) should be beneficial as the bulk of needs until the first quarter of 2016 will be covered by the low cost ESM-IMF loans. At the same time the positive impact from the expected decline of market borrowing rates may be offset by the sovereign borrowing at longer tenors. Hence no significant positive impact is anticipated from the market financing actions in the immediate horizon.

Additionally, the reduction in the base rates over 2014 will have their first concrete impact over 2015, due to the time lag in indexing. However, as regards the outstanding stock of floating-rate debt, base rates in the short to medium term are expected to increase and impact negatively on interest payments.

Overall near-term total interest payments are forecast to be approximately the same level as 2014.

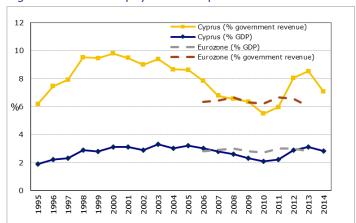

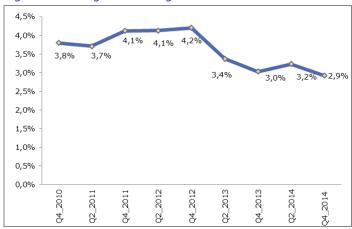

Figure 15: Interest payments on public debt

CASH MANAGEMENT

The Government General Account, which in the Cyprus' Constitution is called the Consolidated Fund, is the government's main account held with the Central Bank of Cyprus. Credit balances at the account do not earn any interest.

Cash management by the Public Debt Management Office covers the setting of minimum and maximum liquidity amounts within which the State should cover its cash flow needs of a given period as well as the utilisation of any excess liquidity should this arise.

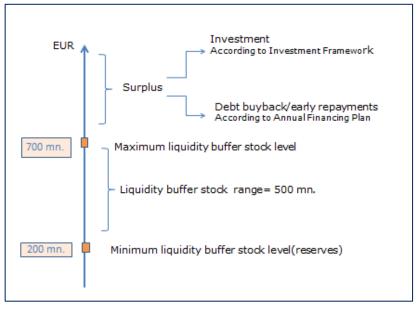

The Public Debt Management Law states that the minimum and maximum liquidity range should be decided by the Council of Ministers. The limits are variable and can change at least quarterly. The minimum and maximum liquidity amounts have been set by the Council of Ministers at €200 million and €500 million respectively and are held at different accounts at the Central Bank. This allows effectively a liquidity range of €500 million for all cash flow management operations, and additional €200 million as reserves (Figure 17).

If the cash balance at the Government General Account moves below the €500 million benchmark point the State has to borrow to cover the difference. If on the other hand liquidity exceeds €500 million the State may, but is not required to, proceed with an investment of the surplus or undertake a debt buyback or prepayment.

The investment framework of excess liquidity is drafted by the Public Debt Management Office and approved by the Minister of Finance. The latest Investment Framework was endorsed in early 2014, and specifies relevant parameters for the investment of excess liquidity in money market instruments.

During 2014 cash levels evolved above €500 million. Under the Investment Framework of 2014, certain investment activities were undertaken in the form of fixed term deposits in the domestic banking system over May and June. Table 15 of the Appendix shows the cash balances at monetary financial institutions during the year.

Figure 17: Institutional structure of the government cash management

RISK MANAGEMENT

The covering of the government financing needs and the public debt management function implies unavoidable financial and operational risks for the State. The general principle followed is that risk minimisation takes priority over cost minimisation.

There are a few categories of financial risk with the most important being the market risk and the refinancing risk. The developments of 2014 had mixed results on the debt portfolio risks. The official borrowing by the ESM and IMF has certainly led to an improvement in the debt maturity profile, thereby mitigating refinancing and liquidity risks. At the same time however these loans carry a floating interest rate whilst the IMF loans furthermore, are denominated in foreign currency. These two features exacerbate the market risk resulting from interest rates and foreign exchange rates. Additionally, the debt maturities in the immediate post-Programme period, and specifically between 2017-2020, pose refinancing risks.

It is important to highlight that risk management of public debt does not, in the ordinary application, cover the debt sustainability assessment since the latter is related mostly to fiscal and macroeconomic indicators, conventionally the GDP and the fiscal balance. Thus the debt sustainability analysis focuses on macroeconomic factors and prospects and is not the subject of public debt management.

Market risk

Market factors result in risks for the existing or expected debt portfolio, via the fluctuations in the markets of interest and exchange rates.

(i) Interest rate risk

This risk aspect refers to the readjustment or refixing of interest rates at the time of refinancing of outstanding debt and at the fluctuation of interest rates at the pre-defined payment dates for debt carrying floating rate debt.

Even though a significant volume of redemptions is due within 12 or 24 months its refinancing is expected to be covered via the ESM-IMF loans at low interest rates so that the interest rate risk

stemming from the refixing of debt redemptions is contained at, effectively, the lowest level possible. Moreover the refinancing of the short term debt is achieved at gradually lower interest rates.

However, the market risk from floating rate debt is on an increasing trend. At year end 2014 about 42% of outstanding debt or €7,9 billion was variable interest rate debt (Figure 18). This compares to 12% of outstanding debt at year end 2012, prior to the Programme financing. Indeed, both the ESM and the IMF loans are at floating interest rates⁷. The ESM-IMF loans form already a quarter of the debt stock and by the Programme end they are projected to exceed 40% of the outstanding stock.

Furthermore, commercial bank loans by local authorities and the central government carry floating rate interest. Additionally most loans for project financing are granted by supranational organisations such as the European Investment Bank and are linked to the Euribor with small margins.

A breakdown of the floating interest rate debt (Figure 18) indicates that the vast majority of this debt is low-base rate and low-margin debt. Thus, the interest rate risk stemming from floating rate debt is expected to be limited.

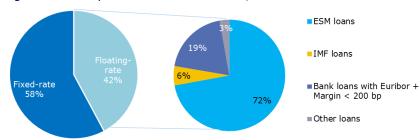

Figure 18: Composition of interest rates, 31st Dec. 2014

_

 $^{^{7}}$ Actually the IMF loans have a large predefined fixed component and a smaller floating rate component.

(ii) Foreign exchange risk

Debt dominated or linked to foreign currency increases instability in the servicing of debt or interest.

Since its entry into the Eurozone, borrowing in foreign currency has been kept at low levels and for short tenors only. During 2014 there were no market issuances in foreign currency.

However, the loans from the IMF are denominated in Special Drawing Rights a specific unit of measurement of the Fund, which is based on a basket of four basic currencies. Therefore amounts vary at withdrawal and servicing of interest and capital according to the value of SDR in terms of euro. Currently the IMF loans are the only debt denominated in foreign currency and account for 2% of outstanding total debt. While future withdrawals from the IMF will increase foreign-currency denominated debt. Its share is expected to remain below 5% of the total debt.

The weakening of the euro has resulted in an appreciation of the IMF debt denominated in SDRs. Whilst the nominal amounts at the time of withdrawal were \le 421 million, at year end exchange rates this debt was valued at \le 443 million. Capital repayments to the IMF do not start before 2017.

Refinancing and liquidity risk

One indicator commonly used to capture the refinancing risk is the share of debt due within 12 months, both short term and long term.

All redemptions due within 12 months at the end of the year 2013 were refinanced by the ESM-IMF loans with the exemption of short term debt which Cyprus refinanced from the domestic market. Thus refinancing risk effectively was reduced to the refinancing risk of short term debt only. While the short term debt was successfully rolled over this was feasible by private placements to a few investors at very short term tenors (mostly 1 to 3 months). The short term debt therefore posed refinancing risks; however these were controlled.

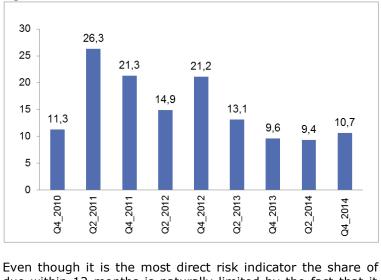

Figure 19: Share of debt due within 12 months

Even though it is the most direct risk indicator the share of debt due within 12 months is naturally limited by the fact that it does not detect significant debt redemptions beyond the 12-month horizon. Thus a second important indicator is the debt refinancing structure grouped in periods.

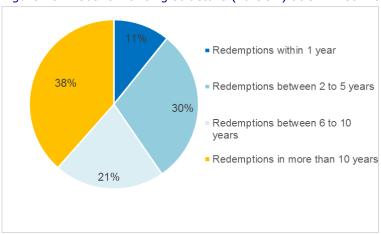

Figure 20: Debt refinancing structure (% GGD) at 31st Dec. 2014

The refinancing risk is the main source of vulnerability in the debt portfolio. Figure 20 indicates that most of the public debt falls due either in the short to medium term (within 5 years) or in the long run (more than 10 years). The debt due within 5 years poses immediate refinancing risks with about €7,5 billion maturing within this period. In fact, certain years have peak maturities exceeding €2 billion. In order to mitigate these risks the Republic of Cyprus has adopted the MTDS 2015-2019 which allows for transactions of liability management nature.

Finally the aggregate debt maturity, i.e. the volume-weighted average remaining maturity of debt, shows a general overview of the refinancing risk. The weighted average remaining maturity remained unchanged over 2014 at 8 years improving slightly from 7,9 years the year before.

The state liquidity levels were comfortable throughout the year mitigating thereby the liquidity risk. This was due to the fiscal outcome being better than expected thus allowing for cash accumulation. The constant short term debt maturities were always refinanced and the liquidity buffers which existed at the beginning of the year were maintained. Table 15 of the Statistical Appendix lists the monthly cash balances of the government of the year.

Refinancing risk for 2015 is expected to be at low levels. If Programme assessments are positive all fiscal needs and long term debt redemptions will be covered timely by the available Programme funding. Sizeable refinancing risks can realise only due to an abrupt reduction in short term funding or the realisation of large contingent liabilities. Notwithstanding this, there are existing comfortable cash levels and for the second event in particular there is further untapped financing in the Programme adequate to absorb a contingent liability shock.

Finally, debt servicing is not expected to evolve at large deviations from the planned payments even if the debt stock carrying floating interest rate or denominated in foreign currency is at an increasing trend. Thus servicing of interest is not expected to significantly influence the management of cash and liquidity indicators.

Credit risk

Credit risk for the government as a borrower results from various counterparties when entering into

- (i) derivative transactions such as swaps
- (ii) operations for the management of excess liquidity i.e. money market (deposit) operations with market counterparties.

By the year end there were no outstanding derivative exposures. Deposit levels in the money market were very low so that the credit risk had been reduced down to nearly a zero level.

Operational risk

Government borrowing transactions and public debt management is associated with a certain degree of operational risk. Improving internal infrastructure, procedures and material controls is a never ending effort which aims at minimising operational risk.

CONTINGENT LIABILITIES

Contingent liabilities are not part of public debt and thus have no direct impact on the government accounts. However, for the assessment of the long term sustainability of public finances and their risks, it is important to examine the contingent or off-balance sheet liabilities, i.e. those liabilities whose realisation depends on future events.

Contingent liabilities in the form of government quarantees, express the explicit commitment of the Republic of Cyprus to guarantee the fulfillment of financial obligations for which the quarantee is issued.

This Chapter describes the main developments as regards existing, new and old guarantee schemes. The full list of guarantees by entity is found in Table 11 of the Statistical Appendix.

Gross and net stock of guarantees

The outstanding amount of government guarantees at end 2014 was €3,02 billion or about 17 percent of GDP, as compared to €3,12 billion at end 2013. The total guarantees portfolio is denominated in Euro.

Excluding guarantees granted to entities of the general government, i.e. the debt of which is already part of the general government debt, the figure reduces to €2,83 billion. This net quarantee balance accounts to 16% of the GDP.

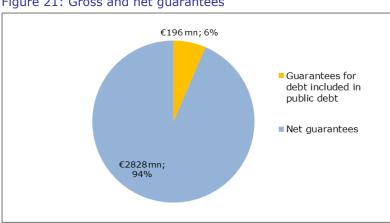

Figure 21: Gross and net guarantees

Outline of outstanding stock of gross guarantees

As can be seen in Figure 22, public corporate bodies, or stateowned entreprises make up the largest component of guarantee beneficiaries. The second largest group, the financial institutions, actually refers to, a single beneficiary, the Bank of Cyprus.

2%
7%

Public corporate bodies

Financial Institutions

Local authorities

International organisations

Schemes for natural persons

Various companies

Figure 22: Gross guarantees by category of beneficiary at end 2014

Guarantees provided to legal entities

The analysis of the beneficiaries comprising the group of legal entities is presented below.

Public Corporate Bodies

The beneficiaries comprising the said category are the Sewerage Boards, the Electricity Authority of Cyprus (EAC), the Cyprus State Fairs Authority, the Cyprus Broadcasting Corporation, the Cyprus Sports Organisation, the Cyprus Olympic Committee, the Central Slaughter-House Board and the Cyprus Theatrical Organisation.

The value of the outstanding government guarantees for loans of the said category is $\le 1,24$ billion of which $\le 0,7$ billion relates to Sewerage Boards and $\le 0,5$ billion relates to the EAC. The purposes of the guarantees to Sewerage Boards are either the facilitation of their infrastructure funding or the construction of sewerage systems, while the purposes of the guarantees for loans provided to the EAC are to improve its capital position in order to cover its

general needs including the EAC generation expansion plant, the upgrade of the transmission systems and the development of the transmission and distribution systems.

Financial Institutions

The guarantees provided to the Bank of Cyprus Ltd for an amount of $\in 1,0$ billion were intended to facilitate the issuance of debt instruments eligible to be used as collateral for liquidity purposes. The said guarantees were initially granted to ex Cyprus Popular Bank and transferred to Bank of Cyprus Ltd in 2013. New guarantees were provided to financial institutions over 2014 for on-lending to domestic entreprises. This new scheme is elaborated later in this Chapter.

Local Authorities

The beneficiaries comprising the said category are the Municipalities and Community Boards of the Republic of Cyprus, which together form the local authorities. The value of the outstanding government guarantees for loans of the said category is €177 million, of which €171 million refers to guarantees provided to the Municipalities and €6 million concerns guarantees provided to the Community Boards. The purposes of the guarantees provided to Municipalities are either for securing funding for new infrastructure such as road construction works and car parking spaces or for improvements in existing infrastructure. The purposes of the guarantees provided to Community Boards are the restoration of road transportation, the construction of pedestrian roads or general improvements in the community infrastructure.

International Organisations

The beneficiary comprising the said category is the European Financial Stability Facility (EFSF). The value of the outstanding government guarantees for loans of the said beneficiary is €285 million. The purpose of the guarantees provided to EFSF is to secure the issuance of bonds by EFSF, so as to address the European sovereign debt crisis and preserve the financial stability in Europe by providing financial assistance to Eurozone states in case of economic difficulty.

Various companies

This category actually comprises the following subcomponents:

- Companies with share capital participation by the state, other than financial institutions
- Private companies
- Not-for-profit organisations

There is one company with share capital participation by the state, other than financial institutions, namely the Cyprus Airways Ltd. The value of the outstanding government guarantees is $\in\!34$ million. The purpose of the guarantees for loans to Cyprus Airways Ltd were to refinance its existing indebtedness and to improve its working capital.

Private companies are local companies of different business sectors of the economy. The value of the outstanding government guarantees for loans of the said category is $\[\in \] 29$ million. The purposes of the guarantees for loans provided to the said companies are for the improvement of working capital and for the enhancement of business activities.

The only beneficiary comprising the not-for-profit organisations is the Satirical Theatre, a private theatre. The value of the outstanding government guarantees for loans of the said beneficiary is €2 million. The purpose of the guarantees for loans provided to the said beneficiary is for the completion of the construction of the cultural center of Vladimiros Kaukaridis.

Government Guarantees provided to natural persons

The value of the outstanding government guarantees of natural persons is €211 million or about 7% of total guarantees. The purposes of the guarantees for loans provided to natural persons are mainly for housing (72%) and business (26%) funding. These were granted mainly via a public corporate body the Agency for Equal Distribution of Burdens.

Evolution of outstanding guarantees and provision of new schemes over 2014

Most guarantees showed an overall decline due to normal credit amortisations by the debtors. Exceptions to this trend were the loans by a few private entities, the central slaughterhouse and natural persons.

During 2014 new guarantees were provided to financing schemes of Small and Medium Entreprises. Guarantees of €24 million were provided to the Bank of Cyprus and €12,5 million to the Cooperative Central Bank. The credits are granted originally by the European Investment Bank via the domestic banks for on-lending to domestic entreprises. The state guarantees the domestic banks for any on-lent amounts.

Furthermore, the guarantees for three loans by the Electricity Authority were raised from 80% to 100% of the outstanding loan amounts resulting in a $\[\in \]$ 71 million increase in guarantees. These credits relate to the improvement or expansion of energy producing units and the transmission system.

A guarantee of €1 billion to the Bank of Cyprus for the issuance of bank bonds was renewed for a further period of 6 months.

Risk assessment of government guarantees

The Public Debt Management Law requires the Public Debt Management Office to regularly assess the financial risk of outstanding government guarantees and newly proposed ones.

The first Risk Assessment Report was submitted to the Minister of Finance on $30^{\rm th}$ September 2014. The findings of this report contributed also to the fiscal risk statement of the Ministry of Finance which was submitted together with the proposed State Budget 2015 to the Parliament.

CREDIT RATING DEVELOPMENTS

Over the year there was an overall improvement of the Cyprus sovereign credit rating. Furthermore the credit rating agencies with which the Republic maintains a contractual relation, shared similar views about the credit risk of Cyprus.

In April Fitch, having earlier differentiated between foreign and domestic debt, changed the ratings from CCC (domestic)/B-(foreign) to uniform B- without any further changes during the year. In April Standard and Poor's upgraded to the level of B to proceed by October to an upgrade by a further notch of B+. DBRS also upgraded from CCC to B(low) in the first half of the year. In November Moody's upgraded their rating by three notches to B3.

With respect to the Republic's outlook Moody's along with Standard and Poor's revised from positive to stable. DBRS maintained the outlook as stable throughout the year. Fitch initially revised Cyprus outlook to stable and then to positive.

Regarding the rationale of the rating and outlook improvements the agencies made reference to a shallower recession along with the government's budgetary consolidation measures which contributed to a smaller than expected general government deficit in terms of GDP. Additionally the stabilisation of the Cypriot banking sector, and in particular the strengthening of the largest banks, was cited as the second contributing factor to the improvement in the credit rating.

According to the credit rating agencies, the Republic's environment remains challenging particularly regarding the asset quality of Cyprus' banks which continues to decline despite banking sector overall stabilisation and recapitalisation as well as the uncertainty regarding the effect from the elimination of remaining capital controls on international transactions.

As in the past, further unsolicited assessments have taken place by other agencies with which the Republic does not have any contractual relations. The solicited credit ratings of the Republic of Cyprus at $31^{\rm st}$ December 2014 are shown below⁸:

Agency	Long term debt	Short term debt	Latest stand
DBRS	B (low)	R-5	27-06-2014
Moody's	B3	Not-Prime	14-11-2014
Fitch	B-	В	24-10-2014
Standard and Poor's	B+	В	24-10-2014

 $^{^8}$ More recent developments in the sovereign credit rating of the Republic of Cyprus are available at the website of the Public Debt Management Office, www.mof.gov.cy/pdmo

STATISTICAL APPENDIX

Data for 2014 is provisional. Reference date for all data in the Statistical Appendix is the 31st Dec. 2014, unless otherwise stated
