DEMOGRAPHIC STATISTICS 2018

I. POPULATION ESTIMATES AND VITAL STATISTICS IN THE GOVERNMENT CONTROLLED AREA

1. Population

The population of the Government controlled area is estimated at 875.900 at the end of 2018, compared to 864.200 at the end of 2017, recording an increase of 1,4%.

The proportion of children below 15 was estimated at 16,1% as well as the proportion of persons aged 65 and over, compared to 22,3% and 11,3% respectively in 2000. There was a gradual increase in the proportion of old-aged persons and a decrease in the proportion of children demonstrating the ageing process. The proportion of persons aged 45-64 also increased to 24,1% from 21,7% in 2000, indicating ageing of the working age population as well.

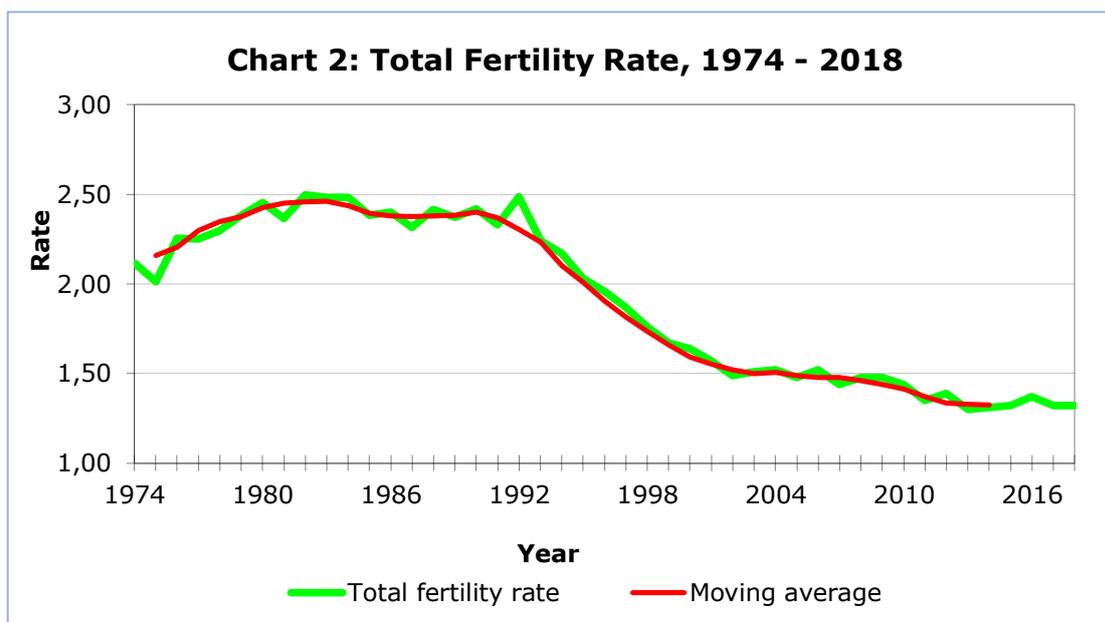

Concerning the religious groups which belong to the Greek Cypriot community, at the end of 2018, the Armenians constituted 0,4% of the community, Maronites 0,8% and Latins 0,1% of the Greek Cypriot community.

The permanent residents of foreign citizenship were estimated at 155.600 at the end of 2018, constituting a proportion of 17,8% of the total population in the Government controlled area.

2. Fertility

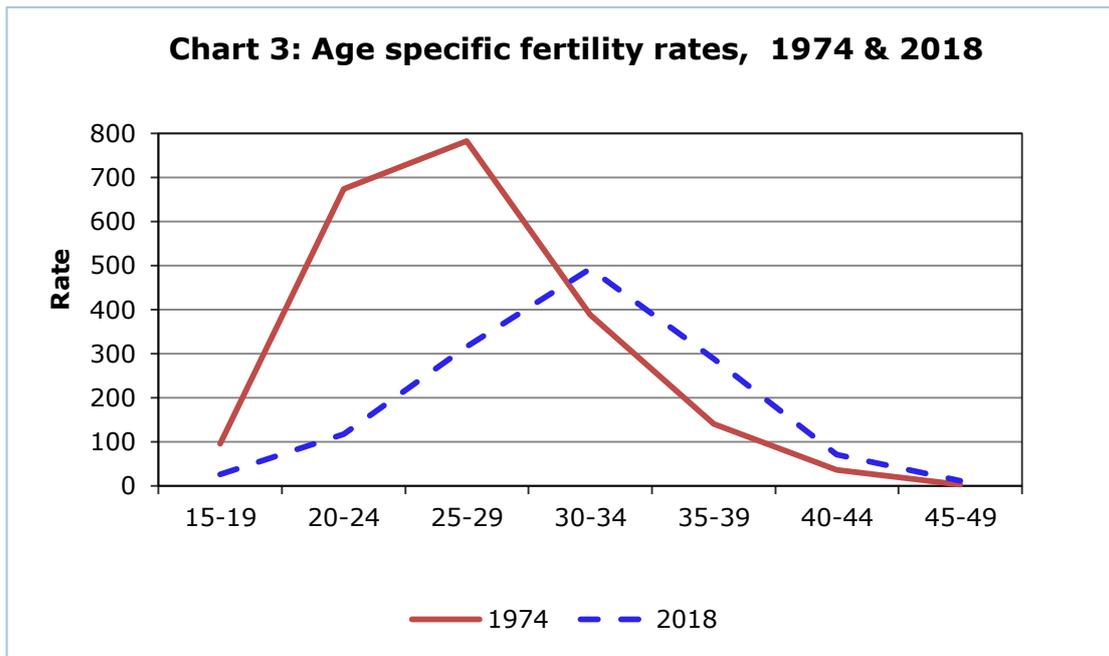

In 2018 the number of births in the Government controlled area increased to 9.329 from 9.229 the year before, giving a crude birth rate of 10,7 per 1.000 population.

The total fertility rate which describes reproductive behaviour unaffected by changes in the age composition of the population, remained fairly low during the past few years. The total fertility rate for 2018 was estimated at 1,32, remaining constant from the previous year. The total fertility rate decreased gradually during the past years, from its local peak of 2,5 in 1982. Since 1995 the total fertility rate remains below the replacement level of 2,10.

Cyprus has one of the lowest proportions of extra-marital births in Europe and fertility is mainly marital fertility. In 2018, 1.752 children were born out of wedlock constituting a proportion of 18,8% of the total number of births.

The mean age of women at the birth of their first child was 29,4 years in 2018 while the mean age at birth irrespective of the order of child was 31,0 years.

3. Mortality

The number of deaths in the Government controlled area reached 5.768 in 2018 and the corresponding crude death rate was 6,6 deaths per thousand population.

Expectation of life at birth was estimated at 80,7 years for males and 84,6 years for females in 2018 compared with 80,0 years for males and 84,1 for females in 2017.

Infant mortality has admittedly reached a very low level, estimated at 2,4 infant deaths per 1.000 live births in 2018.

4. Migration

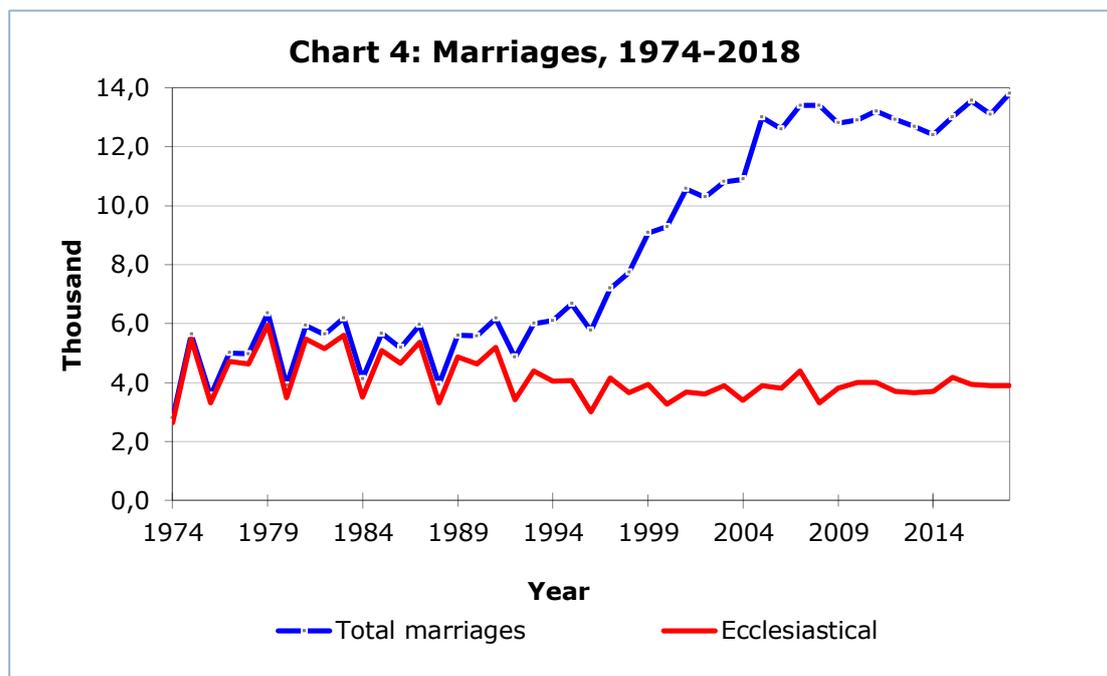

Net migration in Cyprus has been positive from 1983 to 2011. For the period 2012-2015, net migration has been negative. As from 2016 net migration became positive again. In 2018, it was estimated at 8.102.

Long-term immigrants (Cypriots and foreigners arriving for settlement or for temporary employment for 1 year or more) were 23.442, compared to 21.306 in 2017.

The number of emigrants (Cypriots and foreigners who had resided in Cyprus for at least one year) was estimated at 15.340 in 2018 compared to 15.105 in 2017.

5. Marriages

The total number of marriages in 2018 increased to 13.783 from 13.062 the year before. As in the past few years, a large number of foreigners who married in Cyprus by civil marriage were not residing in Cyprus. Out of 9.865 civil marriages celebrated in 2018, only 2.859 were civil marriages of residents of Cyprus. Thus the total number of marriages of residents totaled 6.777 and the crude marriage rate for residents was calculated at 7,8 per 1.000 population.

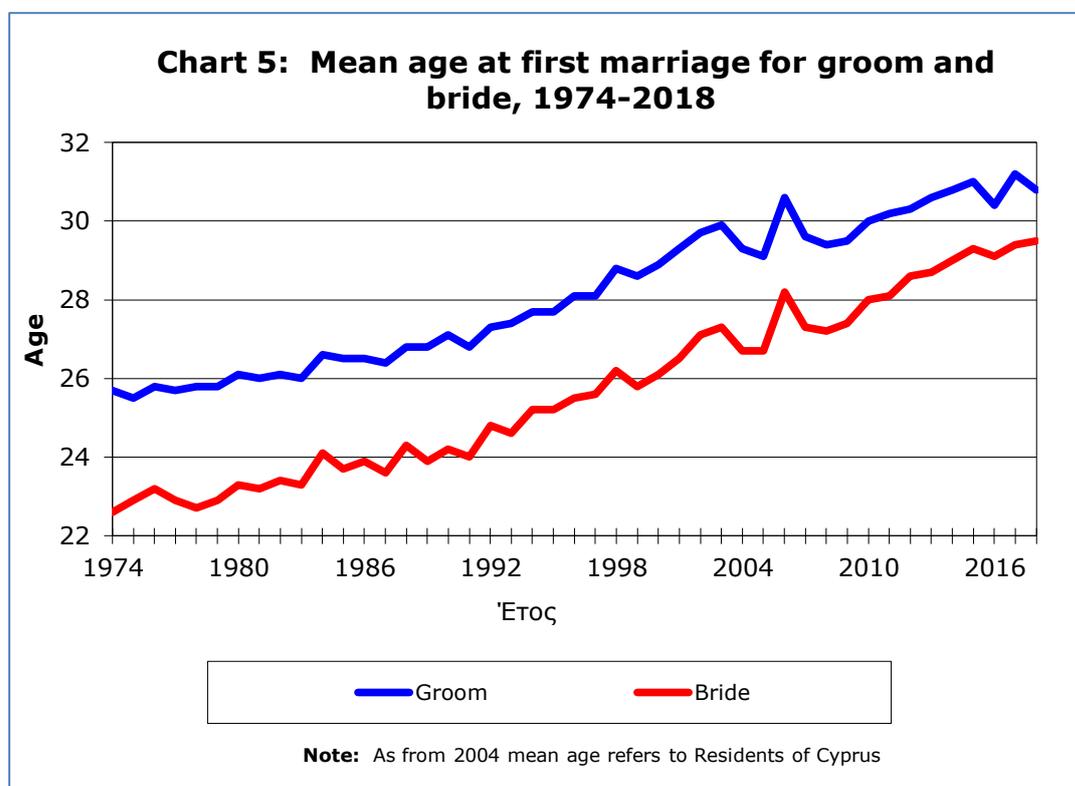

In 2018 the number of ecclesiastical marriages remained about the same as in 2017 (3.918 as compared to 3.942 in 2017).

As mentioned above, civil marriages of residents of Cyprus numbered 2.859 or 29,0% of the total civil marriages celebrated in Cyprus. In most cases, in 52,7% of the civil marriages of residents of Cyprus, the groom and the bride were of foreign nationality, in 20,3% the groom was Cypriot and the bride of foreign nationality, in 8,6% of the cases the bride was Cypriot and the groom of foreign nationality and 18,2% cases concerned Cypriot spouses.

Citizens of India, Pakistan, Romania and Bangladesh were the main nationality groups of foreign grooms, residents of Cyprus, who had a civil marriage in 2018, while for brides the main nationalities respectively were of Romania, Russia, India and Bulgaria.

First marriages for both partners constituted 78,6% of marriages of residents, 14,0% were remarriages for one partner and 7,0% were remarriages for both partners.

Mean age of male residents of Cyprus at first marriage was calculated at 30,8 years, 31,5 for ecclesiastical marriages and 29,5 for civil. Similarly mean age of women at first marriage was calculated at 29,5 years, 29,6 for ecclesiastical marriages and 28,4 for civil. Age at first marriage continues to be lower in rural than in urban areas for both grooms and brides.

6. Divorces

The total number of divorces in 2018 was 2.114 and the crude divorce rate was calculated at 2,43 per 1.000 population. The total divorce rate, which shows the proportion of marriages that are expected to end up in divorce, rose to 337,2 per 1.000 marriages in 2018, from 41,6 per 1.000 marriages in 1980.

A proportion of 49,7% of divorced couples reported no dependent children under 18 years old, 24,6% reported one, 18,2% two and 4,7% reported three or more dependent children. The median duration of marriage is estimated at 10,0 years in 2018.

7. Comparison of demographic indicators of Cyprus with the European Union countries

The population of Cyprus accounts for 0,2% of the total population of the 28 European Union countries. Cyprus has the third smallest population ranking behind

Malta and Luxembourg which had a total population of 493.600 and 613.900 at the end of 2018 respectively.

The rate of natural increase of Cyprus (4,1 per 1.000 population) is much higher than the EU average (-0,7 per 1.000 population).

The age composition of the population portrays a somewhat younger age-structure than the European average. The proportion of persons aged 65 and over is among the lowest, while at the same time the proportion of children below 15 is among the highest.

The abrupt decrease of fertility in Cyprus recorded during the nineties and the increase of the fertility indicator in some European countries in the last few years, resulted in placing the total fertility rate of Cyprus below the average of the European Union countries (1,6 for the year 2017).

Life expectancy at birth in Cyprus is above the average of the European Union (78,3 years for males and 83,5 years for females for the year 2017).

II. SOURCES OF DEMOGRAPHIC DATA

Birth Statistics up to 1998 were estimates obtained using the Chandrasekar Deming method. As from 1999 birth statistics are based solely on registered events occurring during the year, which are registered up to May of the following year.

In the tables referring to births by age of mother, in the age group 15-19 years, there may be cases for which the mother has not completed the 15th year of age.

Death Statistics up to 2004 were estimates obtained through matching of registered deaths with data provided on special forms by priests of cemeteries using the Chandrasekar Deming method. As from 2005 death registration was almost complete, complimented with data provided by priests without any additional estimation. As from 2013 the use of data provided by priests has been terminated due to the fact that the coverage of death registration was considered sufficient.

The total number of deaths up to the year 2012 included all deaths which occurred in Cyprus (of both residents of Cyprus and non-residents) and deaths of residents of Cyprus which occurred abroad and were buried in Cyprus. As from 2013, the number of deaths includes the deaths of residents of Cyprus only.

Marriages are compiled by the staff of the Statistical Service from the Registers at the eleven ecclesiastical districts of Cyprus. The Armenian, Maronite and Catholic Churches report their marriages directly to the Statistical Service. Data concerning civil marriages are obtained from the Ministry of Interior. As from 2003 it has been possible to disaggregate civil marriages of non residents.

Divorces are obtained from family courts. In the total number of divorces, there may be a limited number of divorces by non residents of Cyprus.

Migration statistics are based on the results of the Passenger Survey (long-term immigrants as from 1997 and emigrants as from 2002), as well as on administrative and other sources available to the Statistical Service.

Population estimates for the Government controlled area are based on Census results updated annually to take account of the components of change, births, deaths and net migration. Intercensal estimates are revised when new census figures become available. Population estimates for the period 2002-2011 have been revised on the basis of the results of the Census of Population 2011.

III. DEFINITIONS OF TERMS USED

Crude birth, death, marriage and divorce rates are respectively the numbers of births, deaths, marriages and divorces per 1.000 population.

Gross reproduction rate shows the number of daughters a woman would have if she experienced the age specific fertility rates of a given year and she lived until the end of her reproductive life.

Sex ratio at birth gives the number of male births per 1.000 female births.

General fertility rate is the number of births per thousand women in the reproductive age-groups, 15-49.

Age specific fertility rate is the number of births occurring to women of a given age-group during a year divided by the total number of women in that age-group. It is usually expressed per 1.000 women.

Age specific mortality rate is the number of deaths of a population of a given age-group divided by the population of that age-group.

Annual growth rate is the increase (or decrease) of the population in year T in relation to the total population in year T-1. The population is as at mid or end of the year.

Net migration is the balance between in-migration and out-migration. It may be expressed as a rate per 1.000 mid-year population.

Immigrants are persons who enter Cyprus with the intention to settle in Cyprus or to stay for one year or more.

Emigrants are persons who have left Cyprus with the intention to settle abroad or to stay for one year or more. This category also includes persons who depart from Cyprus after staying more than one year in the country on the expiry of their contract of employment or students after completion of their studies.

Net reproduction rate shows the number of daughters a woman would have if she experienced the fertility and mortality of a given period.

De facto population comprises all the persons who were actually present in the country at a given time. This concept had been applied during all Population Censuses up to 1960.

De jure population comprises all the persons who have their usual residence in Cyprus. This concept was used in Censuses and population estimates after 1960.

Life expectancy at birth indicates the number of years a newborn baby is expected to live if mortality in the various age-groups remains at the level of the period on which the life expectancy is computed.

Infant mortality rate is the ratio of deaths of infants under one year old per 1.000 live births of the same year.

Age dependency ratio is the total number of persons under 15 years old and the elderly population aged 65 and over in relation to the population 15-64 years old (per 100 population 15-64 years old).

Aged/Child ratio is the number of persons aged 65 and over per 100 persons aged under 15 years.

Density is the relation between a population and the area in which it lives. It is obtained by dividing the total population by the area of the territory and is expressed as the number of persons per square kilometre.

Live birth order is the biological birth order of the present child taking account of all live births of the mother.

Total fertility rate gives the number of children a woman would have if she experienced the age specific fertility rates of a given year and she lived until the end of her reproductive life i.e. until her 50th birthday.

Total first marriage rate, is the summation of age specific first marriage rates observed in a given year and represents the probability of first marriage.

Total divorce rate is the proportion of marriages that are expected to end up in divorce (per 1.000 marriages).

Natural increase is the excess of births over deaths. When expressed as a rate per 1.000 population it is the difference between the crude birth rate and the crude death rate.

IV. EXPLANATION OF SYMBOLS

- 0 = Magnitude zero
- n.a = Not applicable
- ... = Data not available
- r = Revised data

V. DETAILED TABLES

The complete set of detailed tables referring to Demographic Statistics 2018, are available in Excel files in the sections presented below, at the website of the Statistical Service, at the following link:
